

Homework 1: Create a Blog Website

Objective:

Convert the provided blog content, both text and images, into a fully functional website using HTML. The goal of this assignment is to practice structuring content appropriately using HTML semantic elements.

Requirements:

Your task is to build a website that displays the blog content accurately and attractively.

1. HTML Structure:
 - Use semantic HTML to structure the content. Include at least 5 of the semantic elements mentioned in the W3Schools module on *HTML Semantic Elements*.
 - Use the following elements as needed: At least 2 headers, ordered lists, unordered lists, strong elements, blank lines, and horizontal rules.
 - Include an HTML head with an appropriate title and a favicon (can use an image from www.svgrepo.com)
2. Images:
 - Include the provided images in the blog.
 - Images must use descriptive alternative text and be sized with width/height attributes
3. Links:
 - Add hyperlinks for resources mentioned in the blog, including an email link
 - Links should open in another tab when clicked
4. Form:
 - Add a form for signing up for the blog's newsletter. The form should include:
 - A text input field for the user's name.
 - An email input field.
 - A submit button (the button doesn't need to perform any action).
5. Display:
 - Ensure all data is displayed as expected.
6. Navigation:
 - Include an 'About Us' navigation link in the header to another HTML file. The 'About Us' file should include header text and optional text (you can generate with ChatGPT)

Submission:

- Your code must be submitted as a repository in GitHub. Please submit the repository link.
- The repository name should be a title that is fitting for the project.
- Changes should be committed to your repository in 2 or more commits with messages that describe the changes.
- Include a README file containing the class name, your name, due date, and a description of the project.
